

GEA Tianjin / 中国民航大学中欧航空工程师学院

Agenda (2/3)

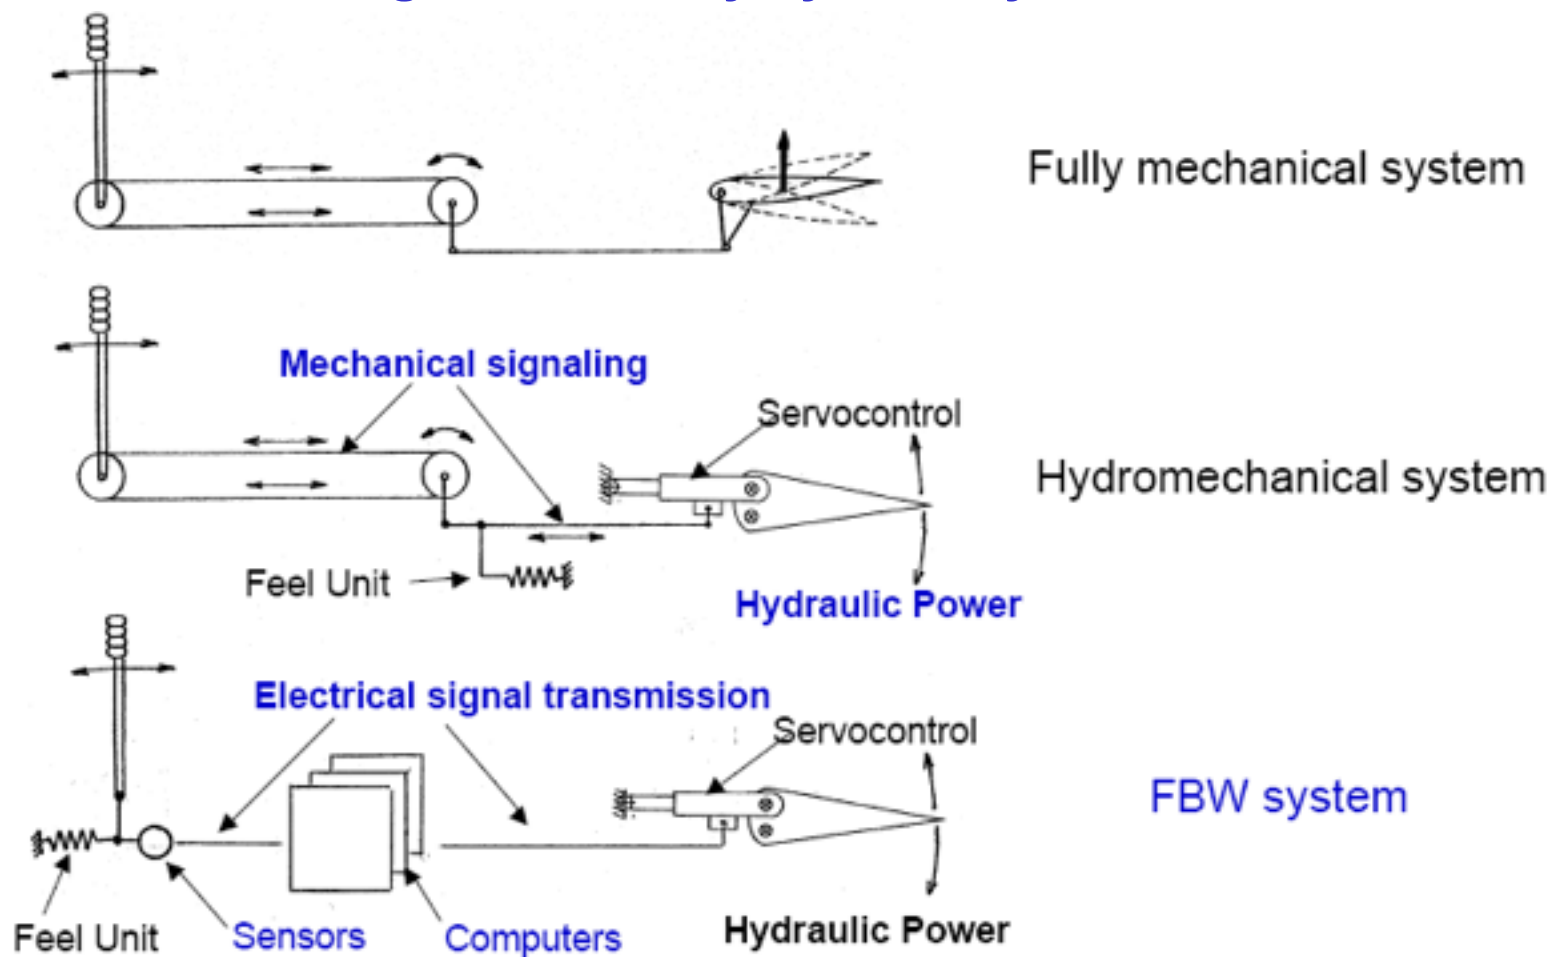

- Module 4 – Design requirements and Safety process
 - 4-1 Requirements
 - 4-2 Safety process
- Module 5 – Aircraft power systems
 - 5-1 Hydraulic power systems
 - 5-2 Electric power systems
- Module 6 – Aircraft Control systems Architectures
 - 6-1 Hydro Mechanical Systems
 - 6-2 Fly by wire systems
 - 6-3 Fly by wire systems new generation
 - 6-4 A320 FAL Visit

Outlines

- Generals : Control surfaces & Cockpit controls
- Mechanical control systems (ATR)
- Hydromechanical control systems (A300/A310/B737 etc)
- First generation Fly by Wire systems (A320/A330/A340/B777)
- New generation, hybrid power sources, full Fly By Wire systems (A380/A400M/A350/B787)
- Future trends, smart and more electric actuation

GEA Tianjin / 中国民航大学中欧航空工程师学院

First generation Fly by Wire systems

GEA Tianjin / 中国民航大学中欧航空工程师学院

Why Fly by wire was introduced?

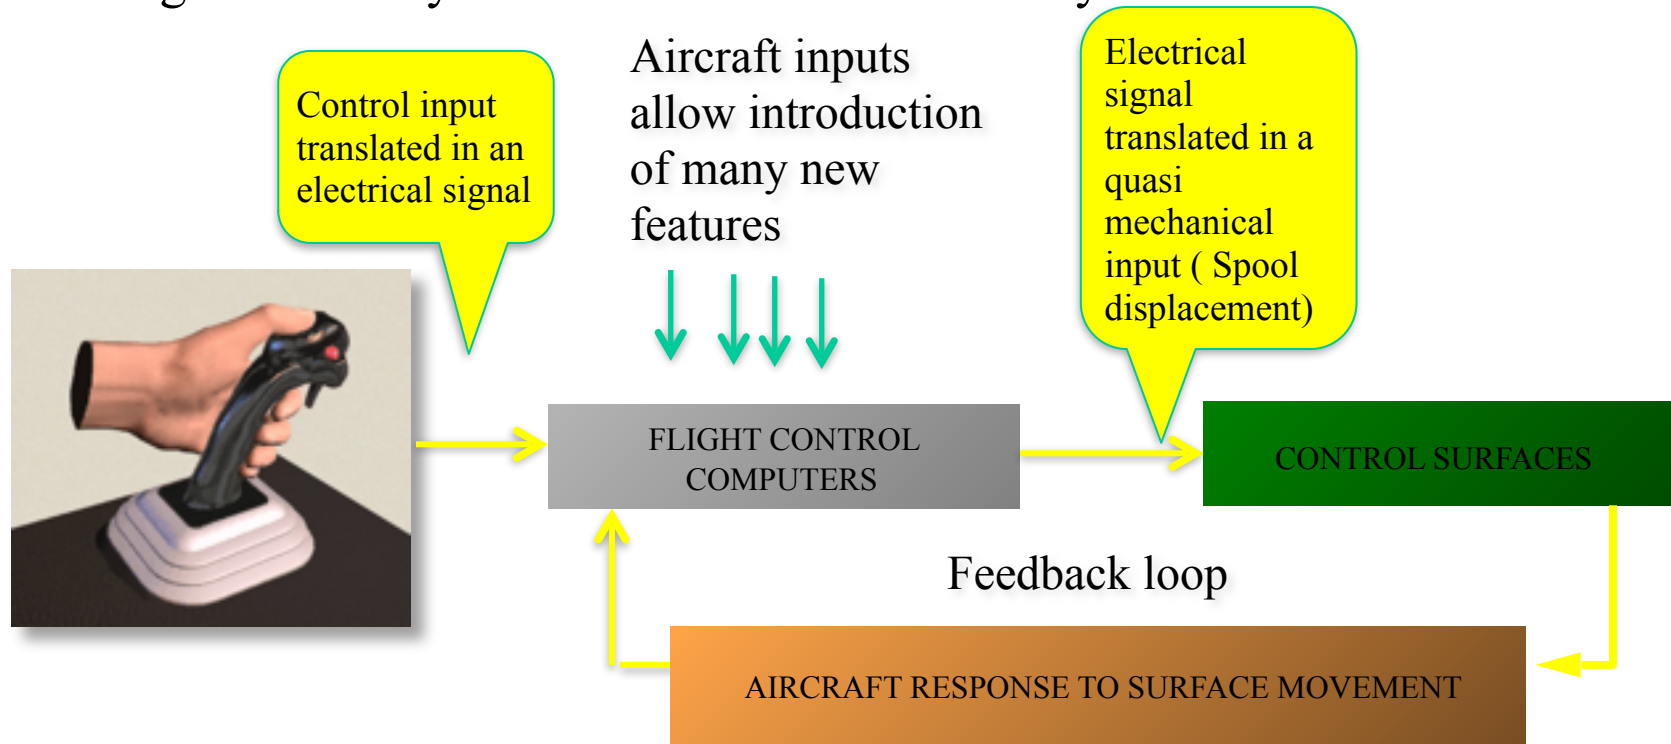

- Hydro mechanical systems are complex, and heavy, they create high cost in indicial build and also in aircraft maintenance.
- Industry was looking for means to simplify and ways to enhance the system performance
- New ways to design are always created together with the availability of new technologies
- At the beginning of 1980 computer technologies has reached a state of maturity which made it feasible to use it for aircraft applications
- The Airbus A320 was the first commercial application of digital fly by wire systems. (now nearly Industry standard)

GEA Tianjin / 中国民航大学中欧航空工程师学院

Fly by wire systems

The main difference to conventional controls are:

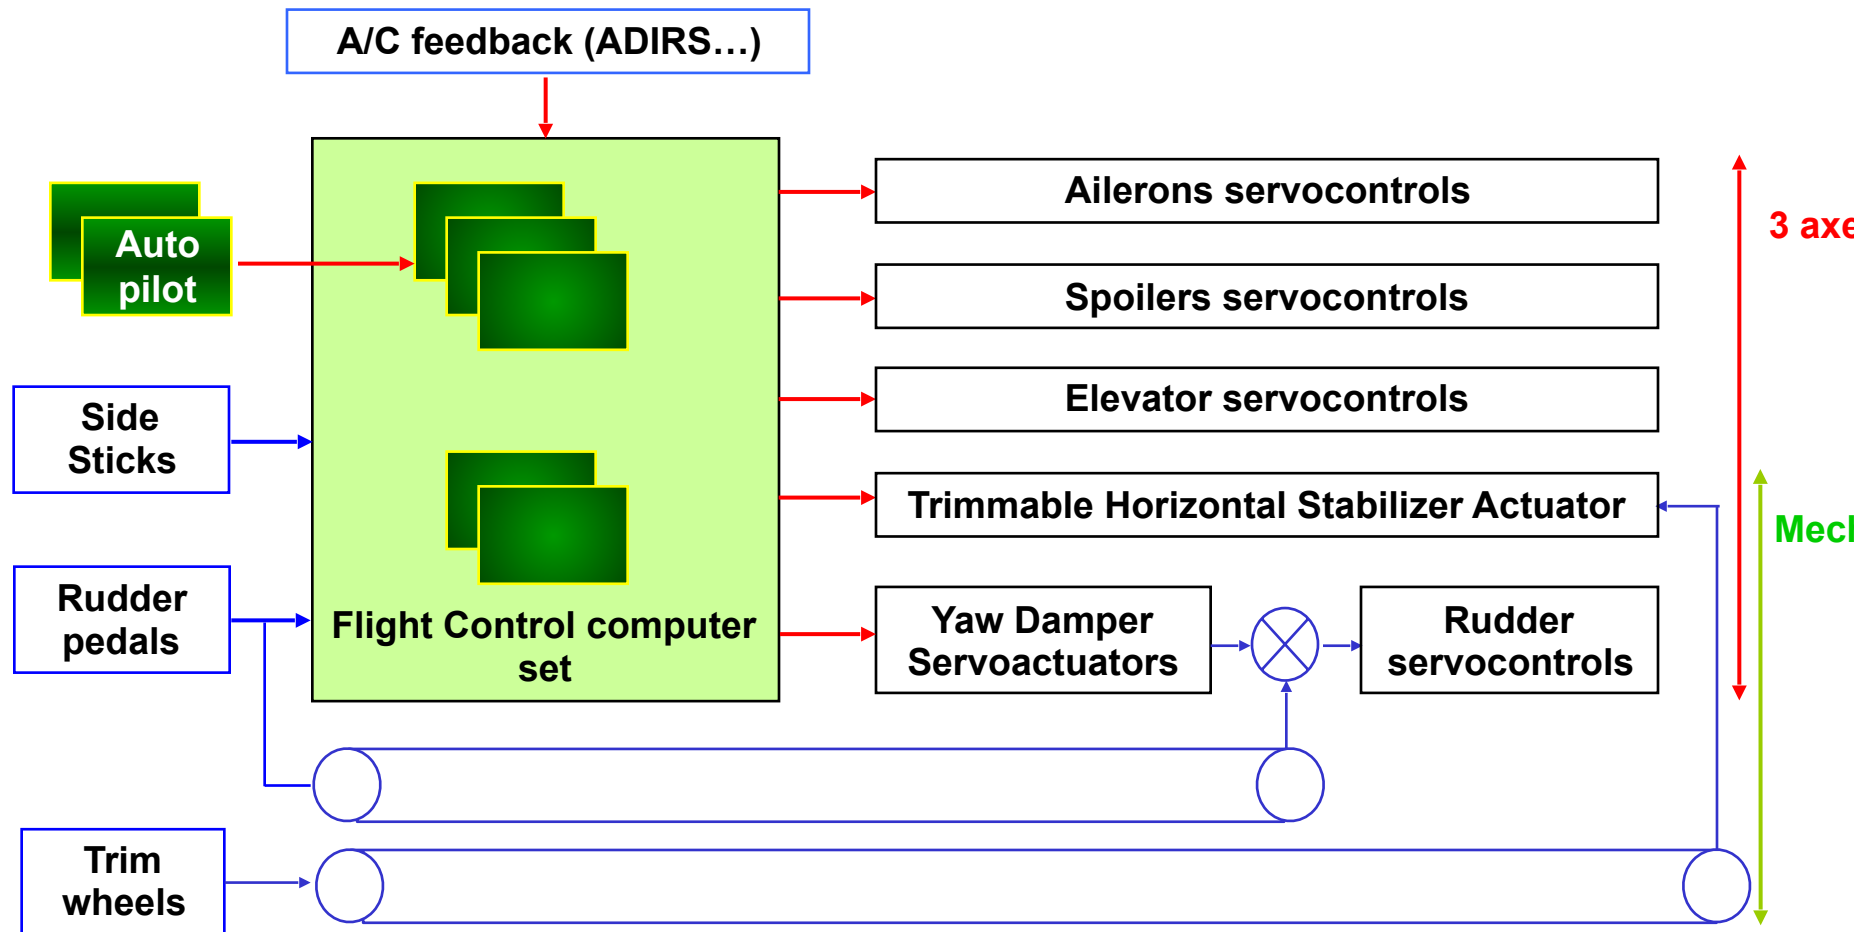

- No mechanical link between piloting device and the surface actuation system
- The flight control system know and consider the Aircraft response (feedback loop)
- The flight control system know and consider many other aircraft data

GEA Tianjin / 中国民航大学中欧航空工程师学院

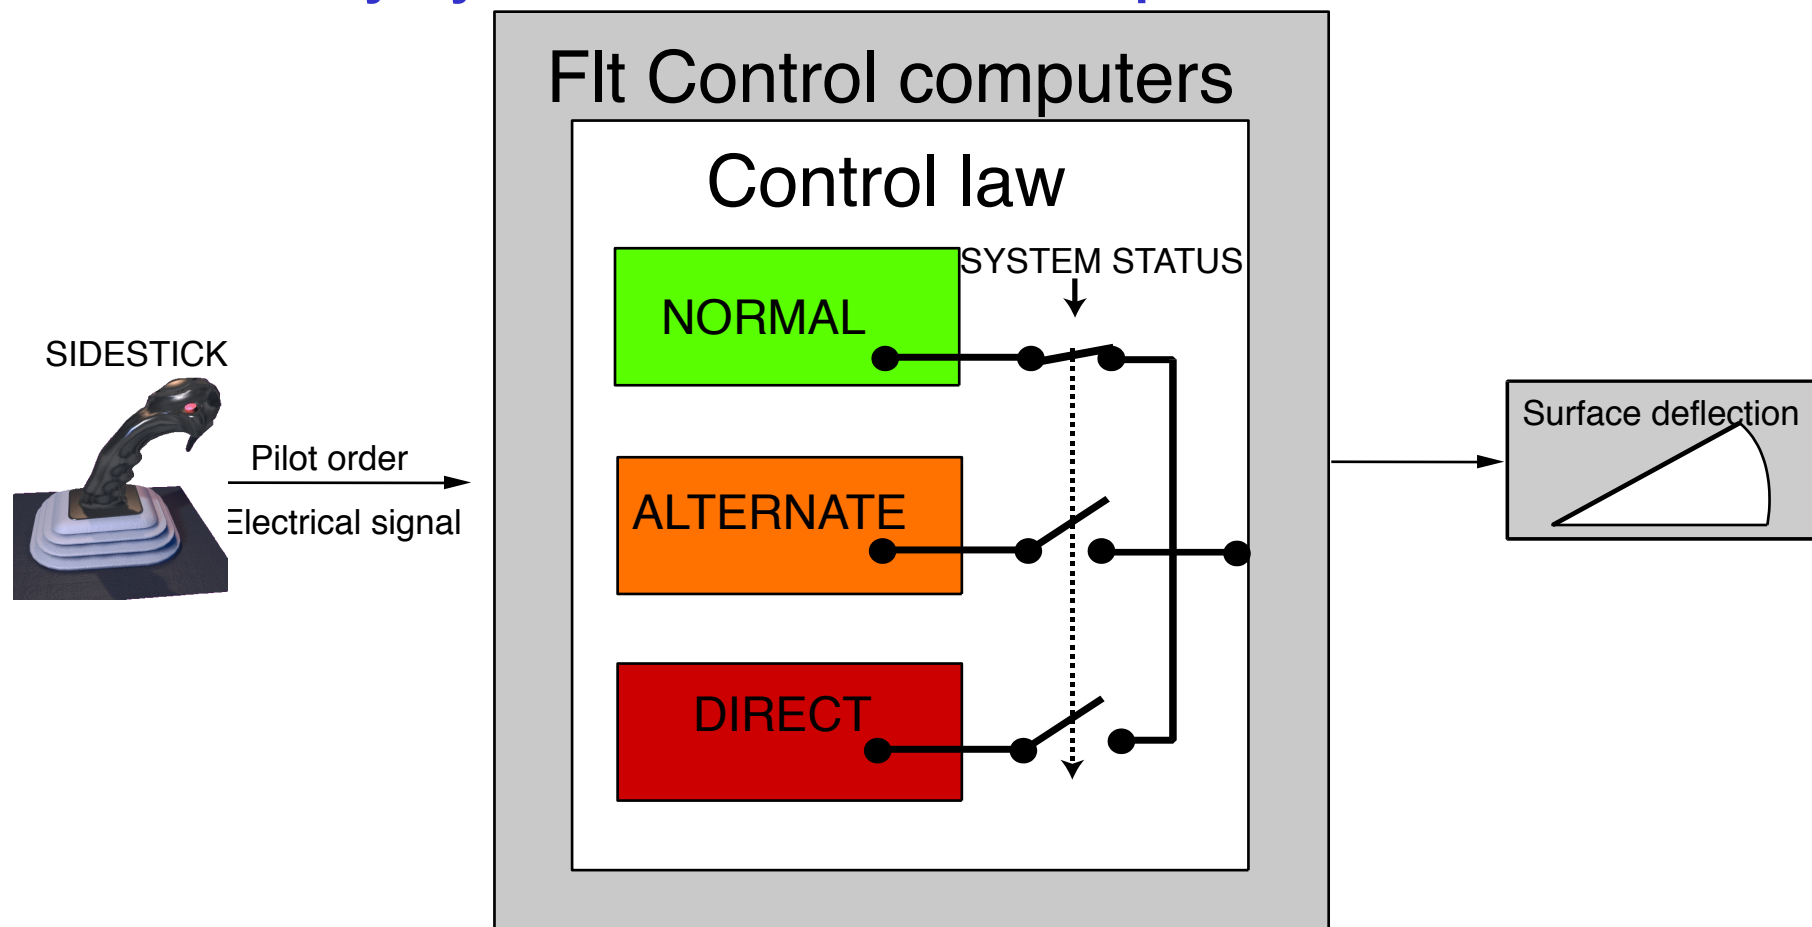

First generation Fly by Wire systems

- A320 System architecture overview

GEA Tianjin / 中国民航大学中欧航空工程师学院

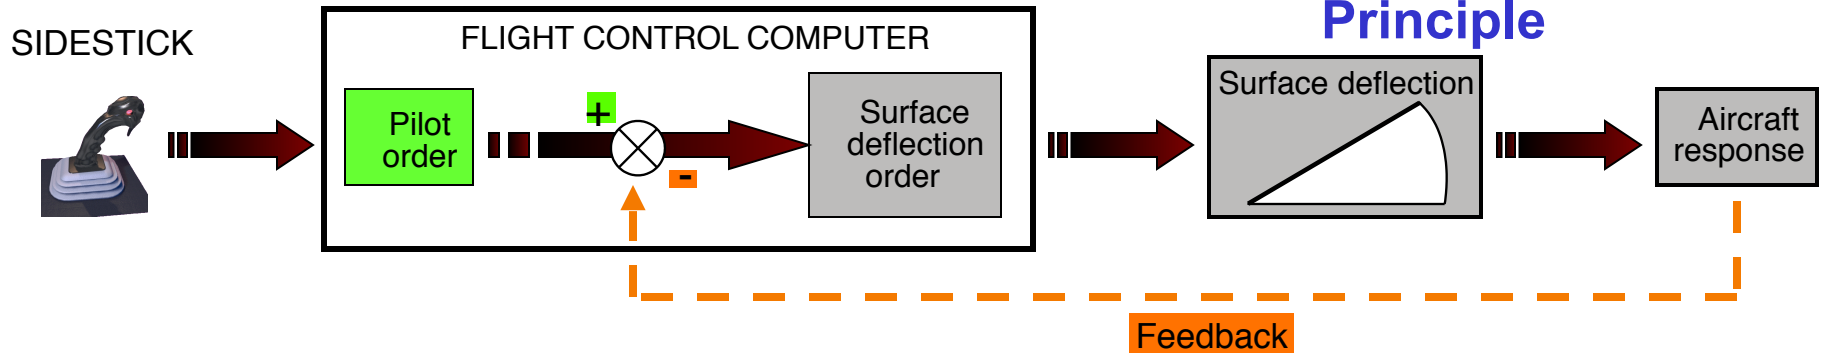

Fly-By-Wire control laws - Principle

Control laws level depend upon Flight Control System status

• Normal and alternate law

Fly-By-Wire control laws - Principle

Pilot's input is converted into an A/C objective. No direct relationship between stick and surface.
The aircraft is servo looped

• Direct law

Pilot's input is directly converted into surface deflection orders.
 Direct relationship (via adapted kinematics) between stick and surface.

GEA Tianjin / 中国民航大学中欧航空工程师学院

Fly-By-Wire control laws - Principle

Control laws are **adapted** according **to the flight phases** and ground to air transition conditions.

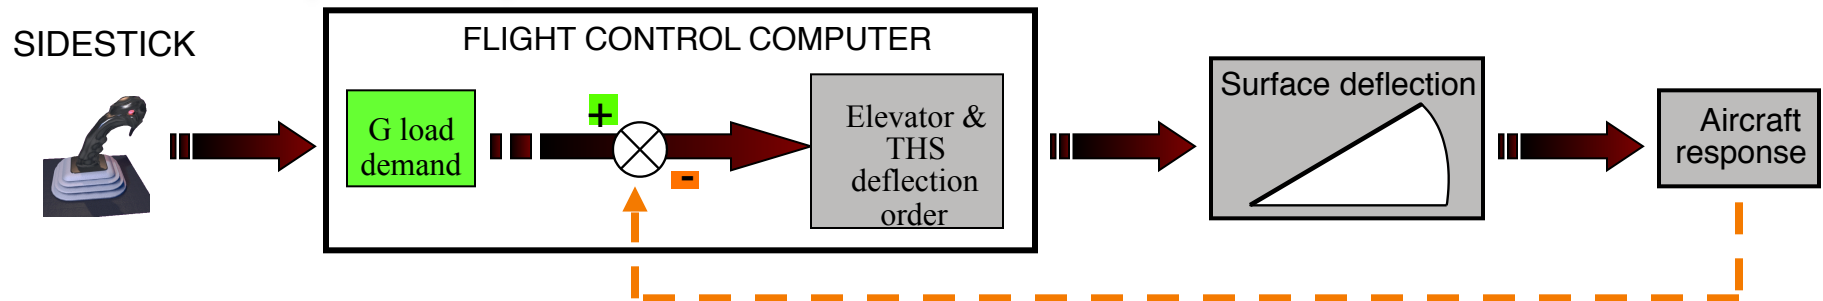

Transitions from one mode to another are smooth and easy.

GEA Tianjin / 中国民航大学中欧航空工程师学院

Fly-By-Wire control laws – Pitch control

- A forward or aft sidestick deflection results in a vertical load factor demand (G Load)

- In short term, commanded flight path is maintained
 - Elevator and THS are automatically deflected to compensate for turbulences, thrust, configuration and speed changes.
 - Aircraft is automatically and continuously trimmed (neutral static stability)
- In long term, pilot's action may be required to adjust flight path as desired.

GEA Tianjin / 中国民航大学中欧航空工程师学院

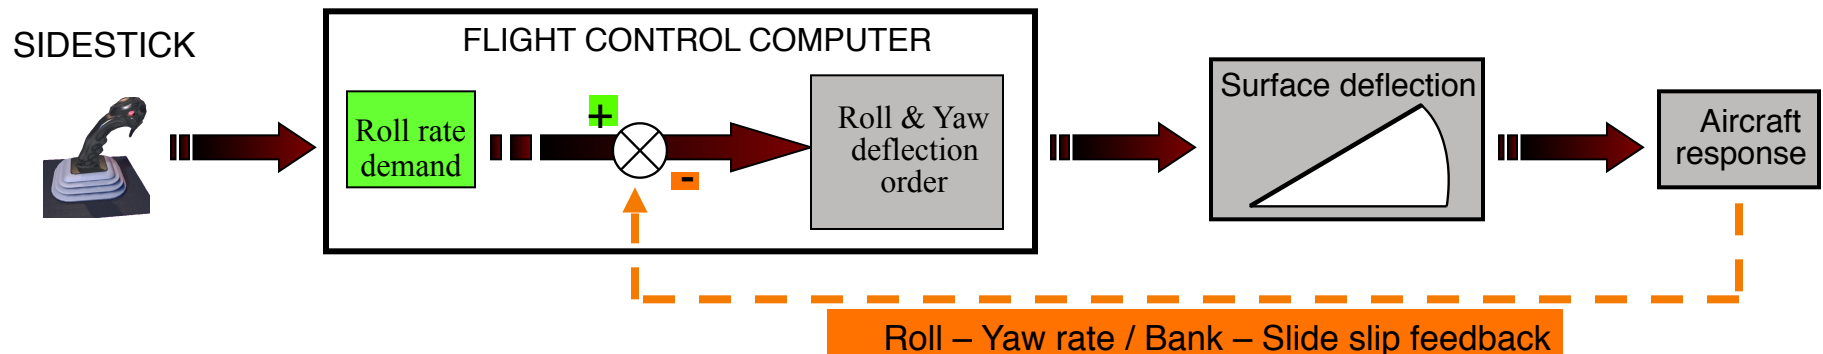

Fly-By-Wire control laws – Pitch control

GEA Tianjin / 中国民航大学中欧航空工程师学院

Fly-By-Wire control laws – Lateral control

- A lateral sidestick deflection results in a roll rate demand.

- The roll rate is achieved by roll surfaces while rudder provides automatic turn coordination and yaw damping.
- The aircraft is laterally stable, no aileron trim is required (neutral spiral stability)
 - Roll and yaw surfaces are automatically deflected to cope with turbulences or aircraft asymmetry, using max deflection if required.

GEA Tianjin / 中国民航大学中欧航空工程师学院

Fly-By-Wire control laws – Lateral control

Fly-By-Wire control laws

Within the normal flight envelope regardless of altitude, speed, Cg or configuration,

- Aircraft is stable and highly maneuverable.
- Aircraft response is precise and consistent about all axis's.
- Provide balanced efforts in both pitch and roll.

GEA Tianjin / 中国民航大学中欧航空工程师学院

Pitch Attitude Protection

- Pitch authority is reduced at extreme attitudes
- Pitch up attitude limits
 - Flaps 0 to 3 - 30°(25°)
 - Flaps Full - 25°
- Enhance effectiveness of:
 - AOA and high speed
 - protection in extreme conditions

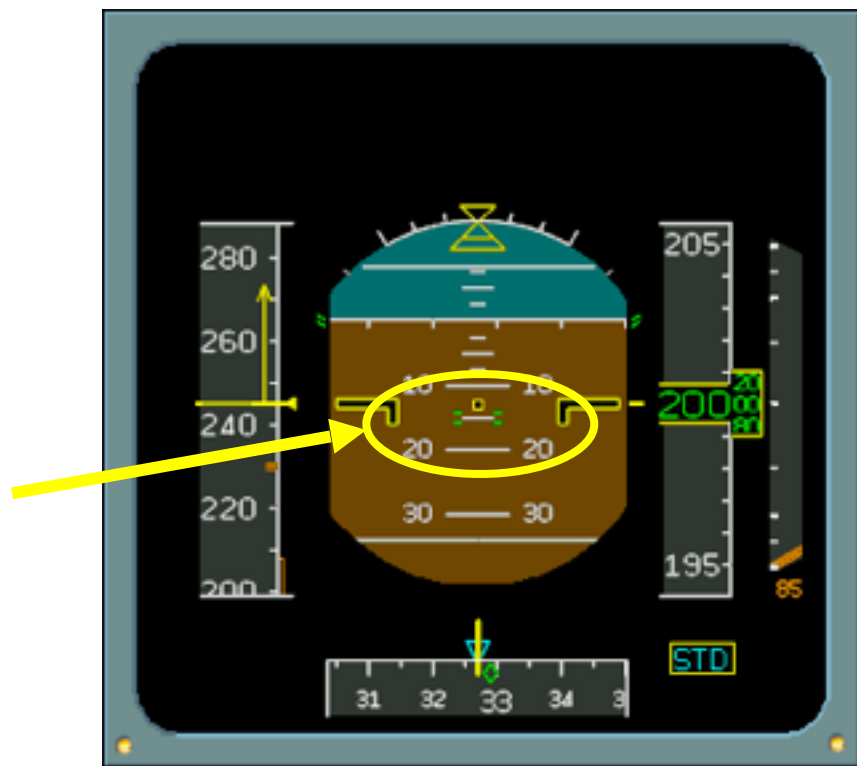

GEA Tianjin / 中国民航大学中欧航空工程师学院

Pitch Attitude Protection

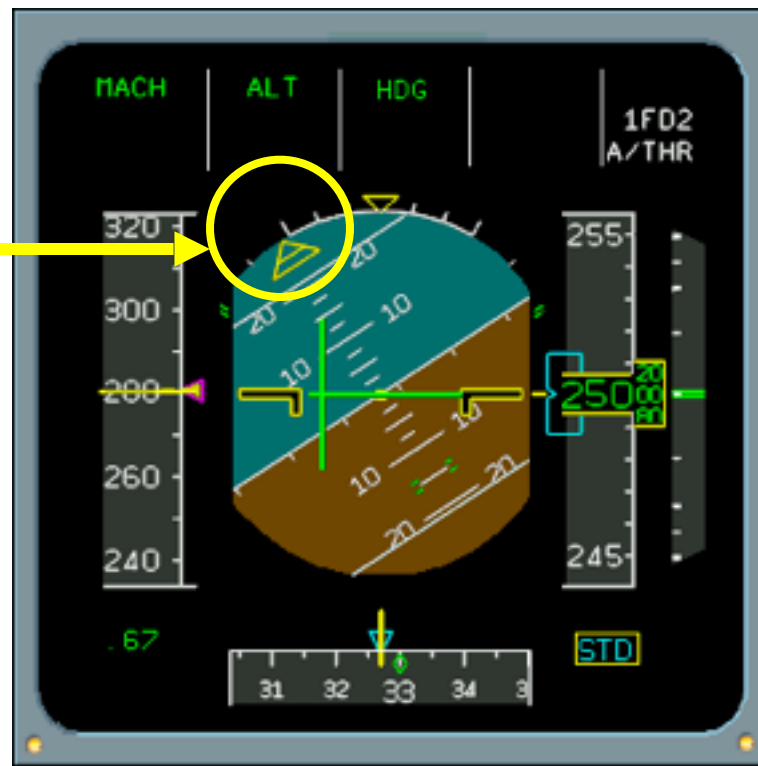

Pitch down attitude limit
-15°

GEA Tianjin / 中国民航大学中欧航空工程师学院

Bank Angle Protection

33° bank angle

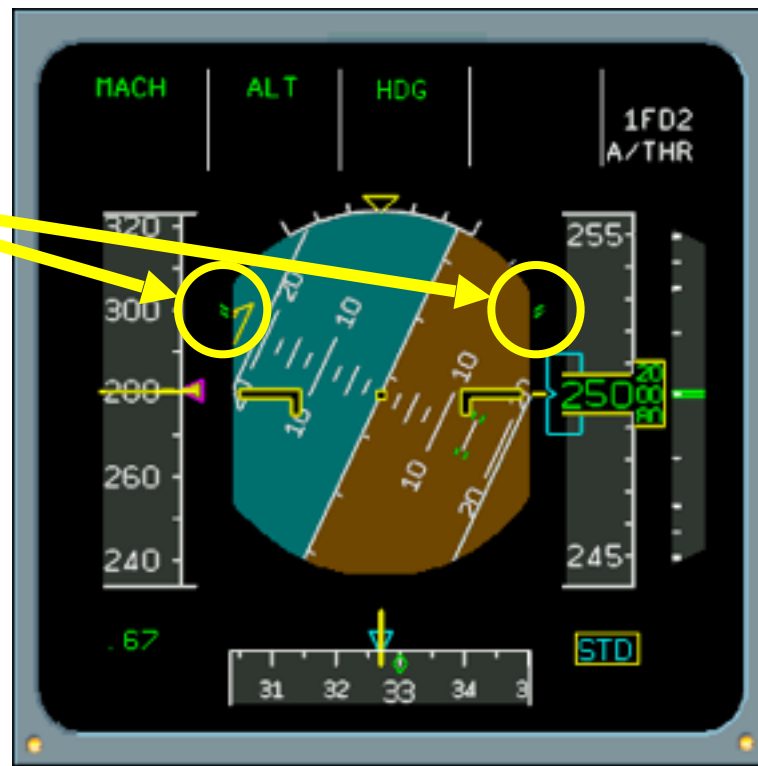

- If side stick is released when the bank angle exceeds 33°, the aircraft will return to and maintain 33° bank angle.
- Automatic pitch compensation provided for bank angles up to 33°.

GEA Tianjin / 中国民航大学中欧航空工程师学院

Bank Angle Protection

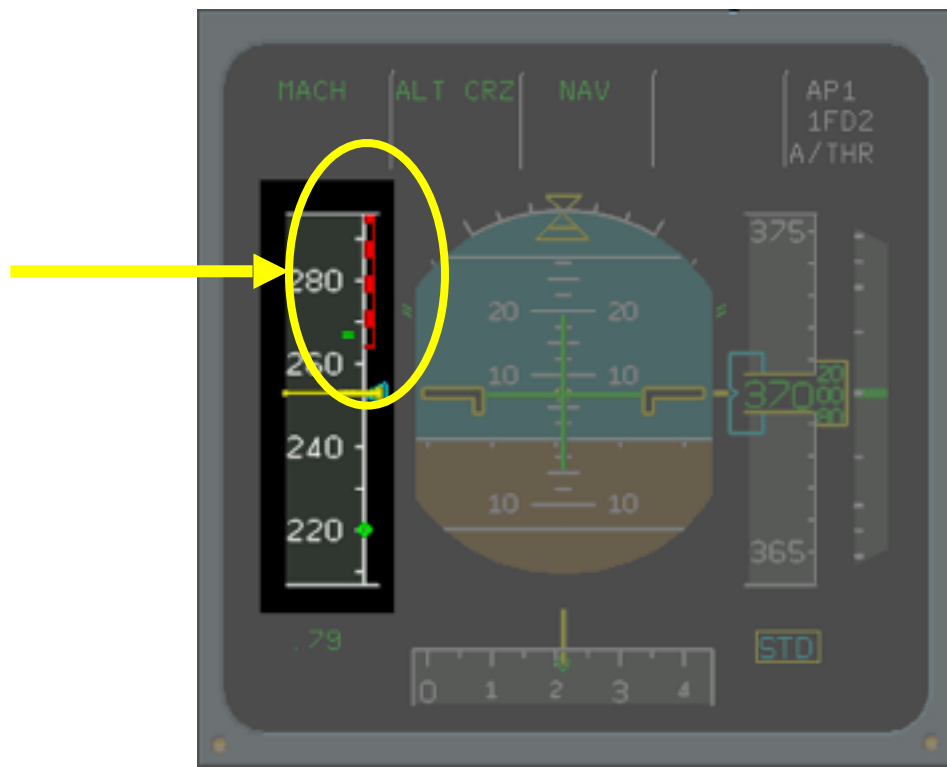

Max bank angle limits
+/- 67°

- AP disconnects and FD bars disappear when the bank is $> 45^\circ$, FD bars reappear when bank angle is $< 40^\circ$
- With full side stick bank angle is limited to 67° (or 45° if AOA or high speed protection).

GEA Tianjin / 中国民航大学中欧航空工程师学院

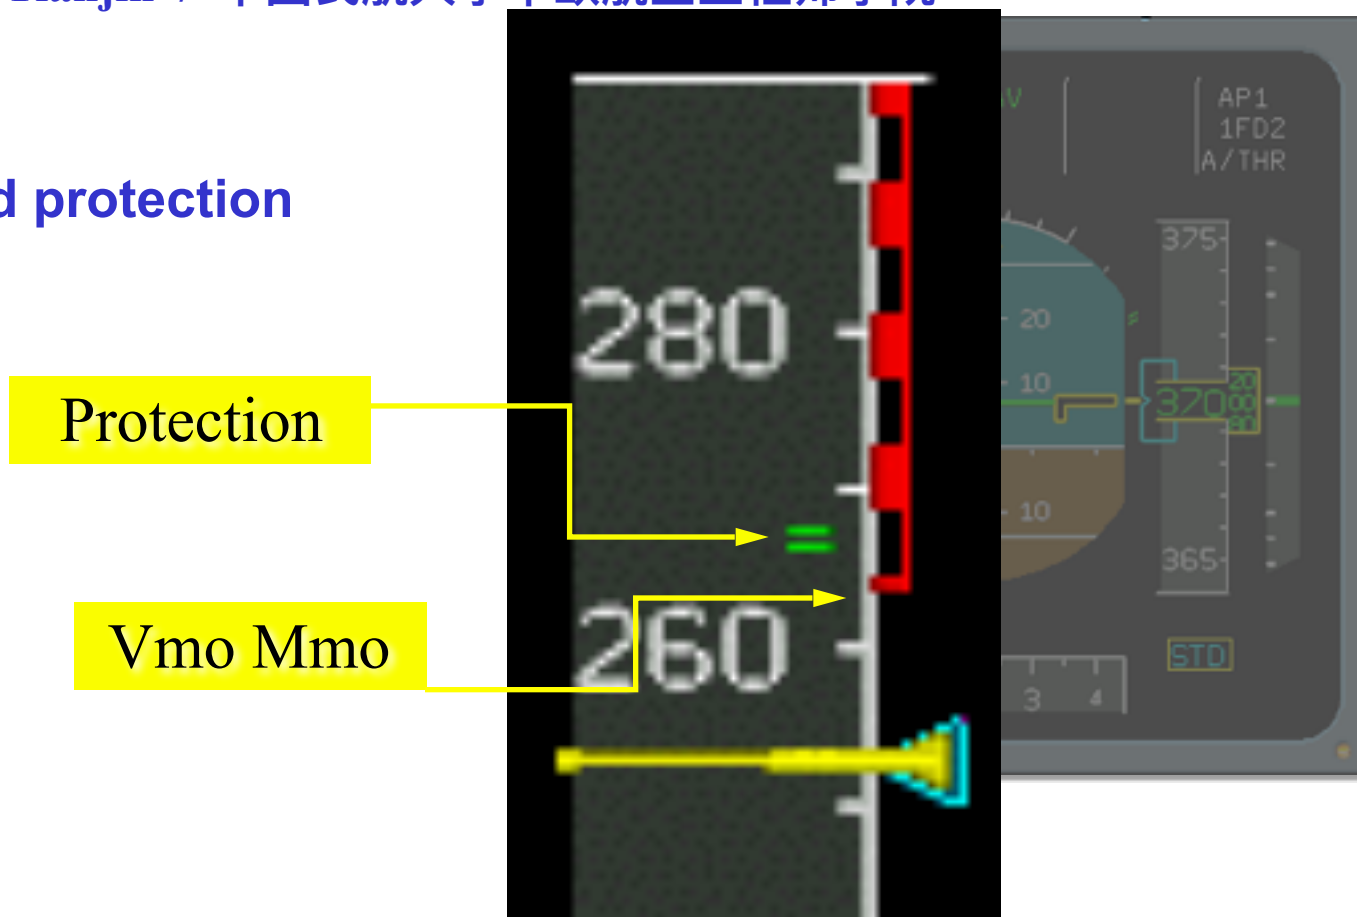

Over speed Protection

V_{mo}/M_{mo} limit

Protects the aircraft from exceeding V_{mo}/M_{mo} limit by introducing a positive load factor (nose - up demand) to the sidestick

GEA Tianjin / 中国民航大学中欧航空工程师学院

Overspeed protection

- Vmo/Mmo is shown as the bottom of the red/black barber pole
- Green dashes indicate the speed at which the protection is activated

GEA Tianjin / 中国民航大学中欧航空工程师学院

High Angle of Attack protection

α_{Stall} :

Sudden loss of lift and or aircraft control

α_{Max} :

Angle of attack reached with full aft stick (max aircraft performance)

α_{Prot} :

Angle of attack from which stick input is converted into angle of attack demand (stick neutral α_{Prot})

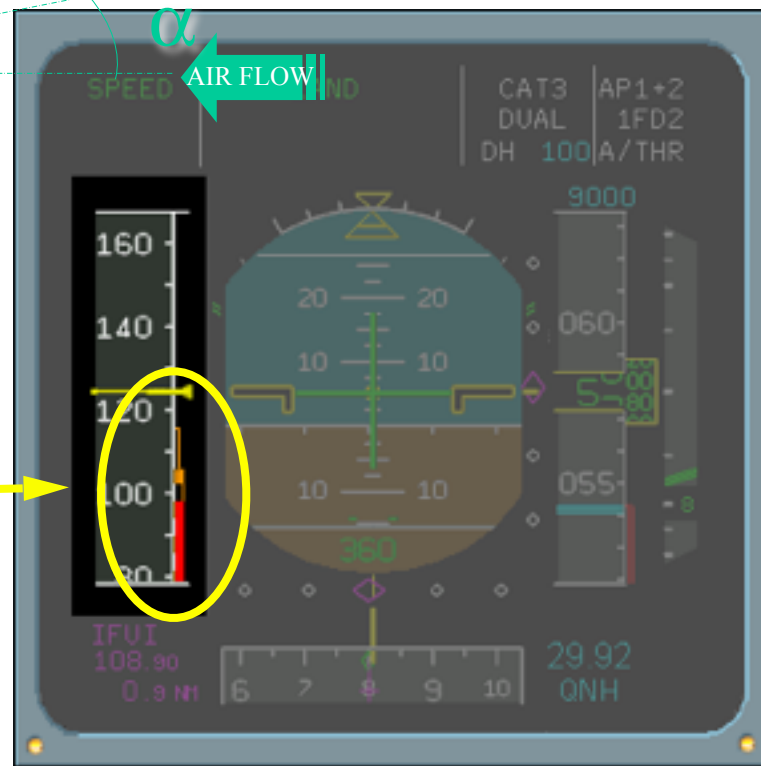

GEA Tianjin / 中国民航大学中欧航空工程师学院

High Angle of Attack protection

High angle of attack limits

GEA Tianjin / 中国民航大学中欧航空工程师学院

High Angle of Attack protection

 V_{ls} $V_{\alpha PROT}$

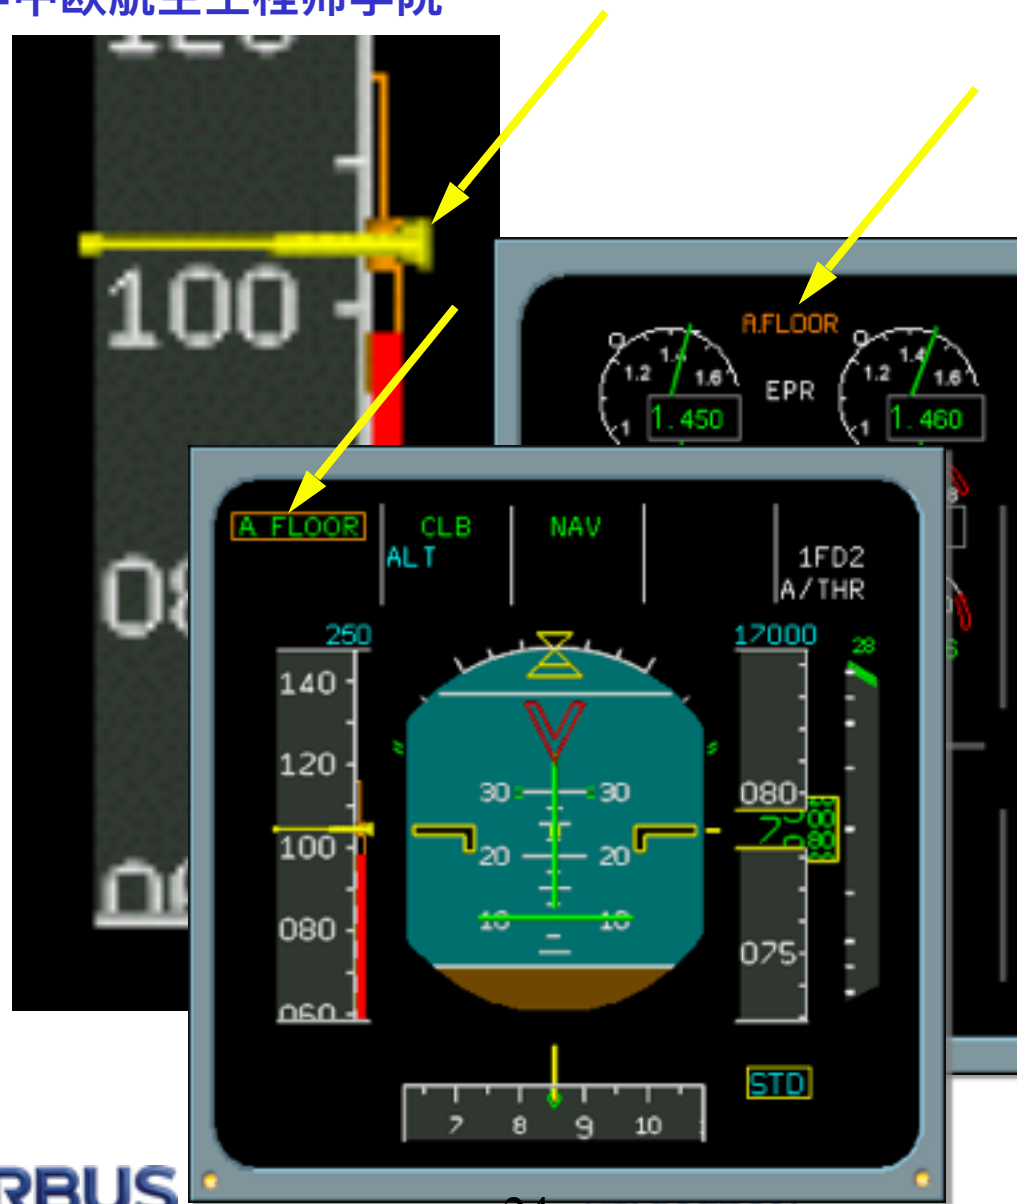

- As speed decreases it reaches V_{ls} , the lowest achievable speed with autothrust engaged
- Between α_{PROT} & α_{MAX} , Floor will activate, autopilot disconnects and speed brakes automatically retract if extended

GEA Tianjin / 中国民航大学中欧航空工程师学院

High Angle of Attack protection

α Floor activated

Fly-by-wire protections

- Allow a pilot to:
 - Have full authority to consistently achieve maximum aircraft performance In certain extreme situations such as Windshear, heavy turbulence, potential midair, GPWS, or TCAS advisories
 - Reduce the risk of over-controlling and or overstressing the aircraft

Maximum aircraft performance is easily achieved by use of instinctive, simple procedures

Airbus Fly-By-Wire – Design considerations -Redundancy

Electrical generation and distribution

- Generation
 - **Two** engine-driven generators
 - **One** APU generator
 - **Two** batteries
 - **One** CSM / G (constant speed motor/generator) driven by hydraulic circuit (Blue), powered by its dedicated pump or RAT
- In case of electrical emergency configuration, **two Fly-By-Wire computers are still powered** and provide high level control law
- Additionally, **extensive segregation rules** have been applied to **minimise common** point risks.

Airbus Fly-By-Wire – Design considerations -Redundancy

Hydraulic generation and distribution

- **Three Hydraulic circuits** (Green , Blue, Yellow)
 - Green pressurized by an engine driven pump
 - Yellow pressurized by an engine driven pump and an electrical pump.
 - Blue pressurized by an electrical pump and RAT.
 - Green and yellow circuit can drive each other by means of the Power Transfer Unit (PTU)
- **Two electro-hydraulic servo-controls per surface.**
- In case of double hydraulic failure, high level control law still available with remaining flight controls.

Airbus Fly-By-Wire – Design considerations -Redundancy

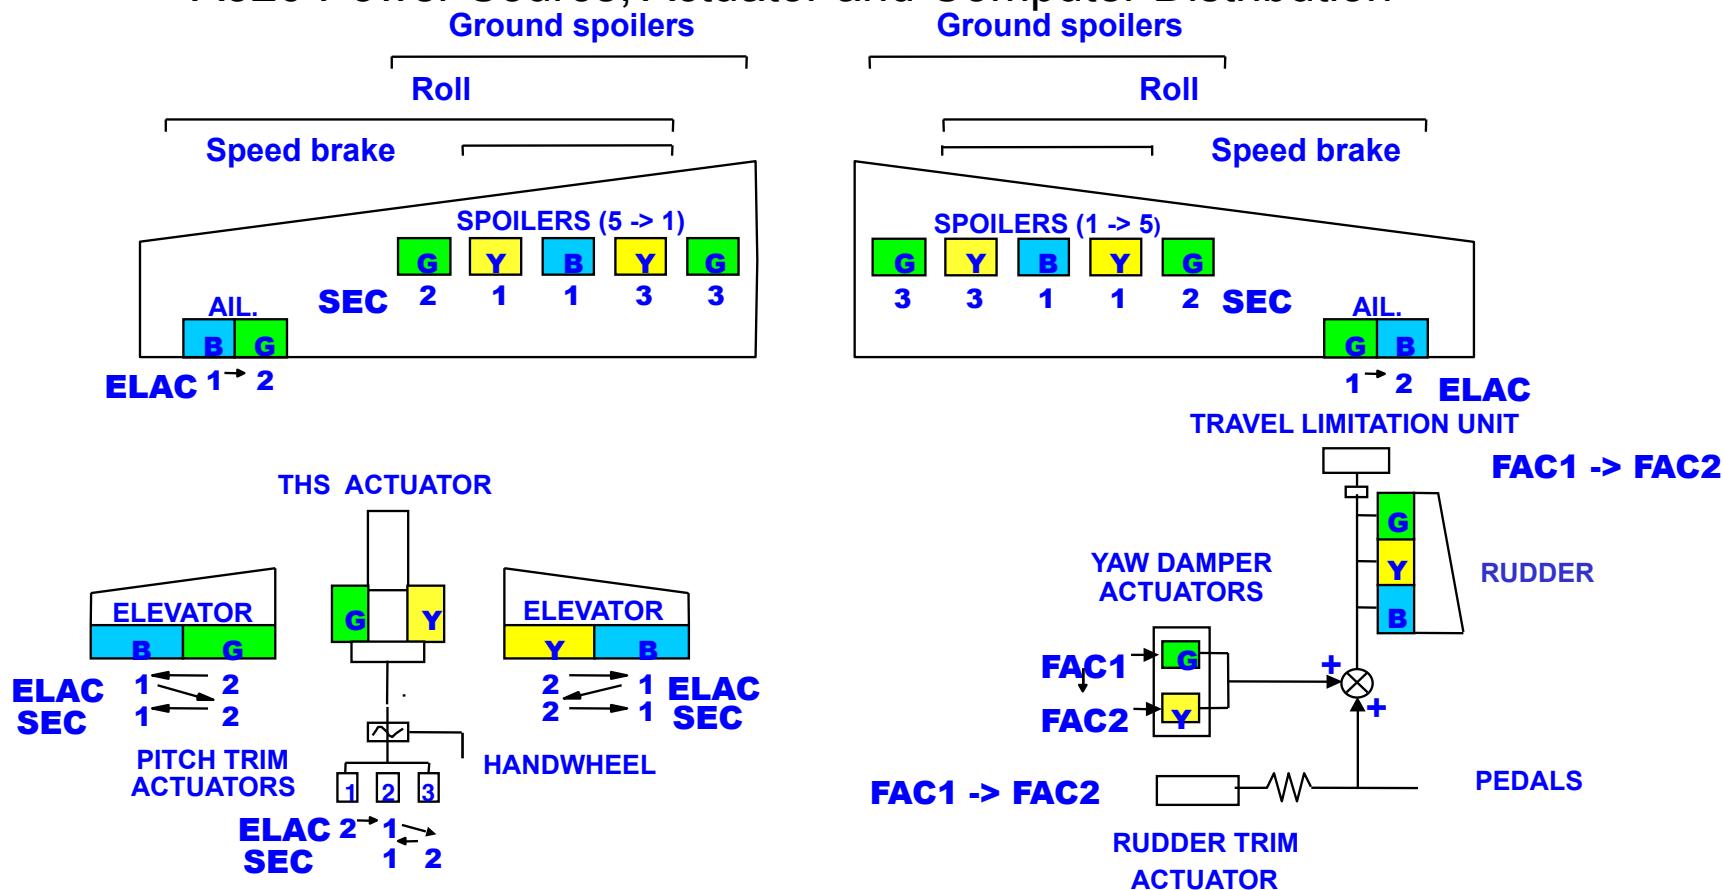

Computer to actuator repartition

- The electrical signalling of the flight control surfaces is achieved by **7 digital computers.**
 - 2 **E**levator and **A**ileron **C**omputers (**ELAC**)
 - 3 **S**poiler and **E**levator **C**omputers (**SEC**)
 - 2 **F**light **A**ugmentation **C**omputers (**FAC**)
- **Four computers** available **on elevator**
- **Two specific computers** are dedicated **to manage the data** from the flight control computers for indication, warnings, maintenance and recording purposes.
 - 2 **F**light **C**ontrol **D**ata **C**oncentrator (**FCDC**)

GEA Tianjin / 中国民航大学中欧航空工程师学院

First generation Fly by Wire systems

A320 Power Source, Actuator and Computer Distribution

ELAC : Elevator and Aileron Computer SEC : Spoiler and Elevator computer FAC : Flight Augmentation Computer

Airbus Fly-By-Wire – Design considerations – Mechanical back-up

A flight control mechanical back-up is provided:

- For Pitch Control: Pitch Trim Wheel
- For Yaw/Roll Control: Rudder pedals

Control the aircraft during a temporary loss of all computers. (design of 1982)

Today's fly by wire control systems have no mechanical back up because of the proven confidence in the electrical system.

GEA Tianjin / 中国民航大学中欧航空工程师学院

First generation Fly by Wire systems

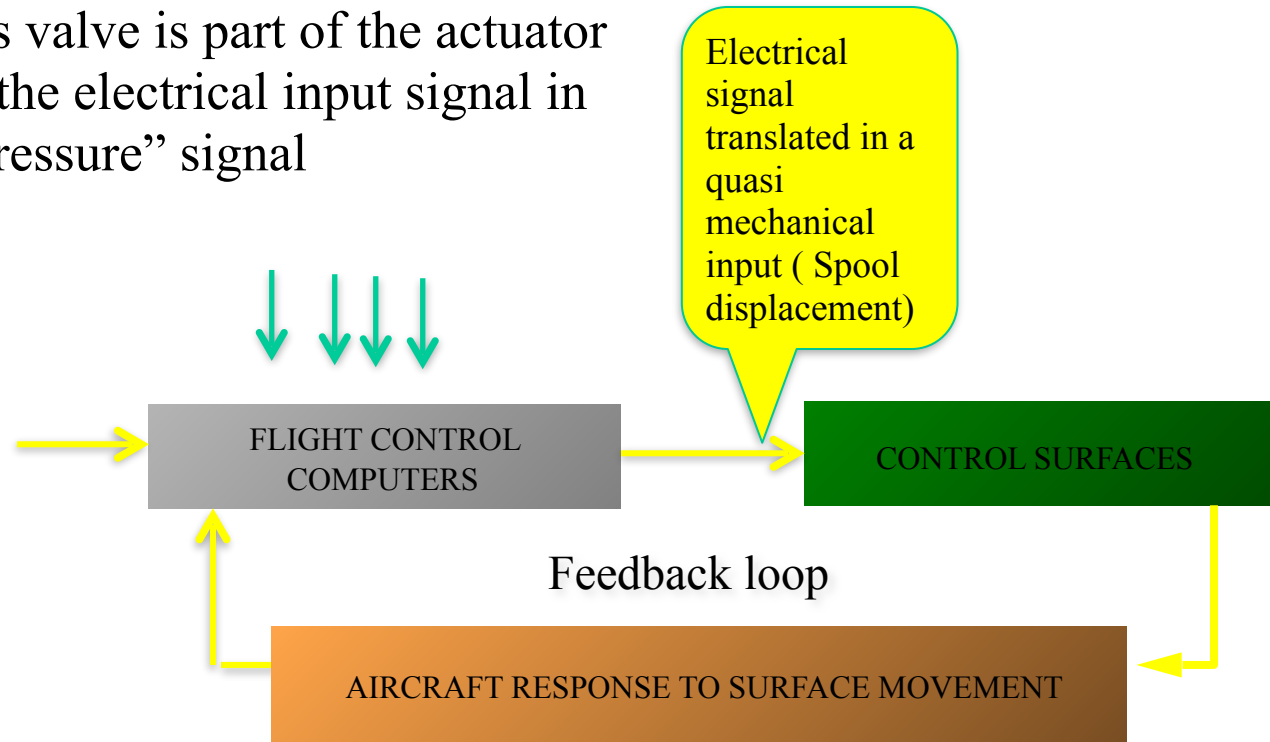

■ Overall benefits of FBW systems

- Simpler system, free of backlash, friction, hysteresis, jamming,...
- Generate direct and indirect weight savings
- Provide a safe, accurate and comfortable flight within the normal flight envelope regardless of altitude, speed, Cg or configuration:
 - Precise and consistent aircraft response
 - Stable and highly maneuverable aircraft
 - Full authority to pilot to achieve the best aircraft performance with intuitive and immediate procedure
 - Reduced risk of over controlling / overstressing the aircraft
- Allow the various models to achieve an unmatched level of operational commonality, which makes them all fly and feel alike, resulting in:
 - Reduction of the overall maintenance costs
 - Reduction of the transition training time.
 - Cross-Crew-Qualification and Mixed-Fleet-Flying
 - Considerable savings for operators
 - Enhanced overall flight safety.

GEA Tianjin / 中国民航大学中欧航空工程师学院

Fly by wire systems

If we focus on the actuation side of a fly by wire system, one of the key components is the servo valve. This valve is part of the actuator and it translates the electrical input signal in a “mechanical/pressure” signal

GEA Tianjin / 中国民航大学中欧航空工程师学院

First generation Fly by Wire systems

- One of the key component is the Electro Hydraulic Servo Valve
- The jet pipe converts kinetic energy of the moving fluid into static pressure
- Input current controls the flapper position

GEA Tianjin / 中国民航大学中欧航空工程师学院

Servo valve Principal

- The jet pipe converts kinetic energy of the moving fluid into static pressure
- Input current controls the flapper position +/-

GEA Tianjin / 中国民航大学中欧航空工程师学院

First generation Fly by Wire systems

- Fly By Wire servo control

Operating modes for a typical fbw Actuator

- **Active :** normal operating mode for one actuator per control surface ; needs hydraulic supply and electrical signalling
- **Stand-by:** normal operating mode for the actuator adjacent to the active one
default mode in case of loss of electrical signalling

In stand-by mode, the actuator provides a velocity dependent **damping** force

- **Self-centering** (SA / LR elevators, A340 500/600 ailerons)
 - in case of loss of electrical signalling, available hydraulic power is used to position and hold a zero deflection
 - must affect two adjacent actuators simultaneously
 - is used when zero hinge moment position might bring uncomfortable flight perturbation or reduce remaining manoeuvrability
- When **depressurized** fluid is trapped within the actuator and **damping** is provided. An accumulator compensates for fluid thermal retraction

GEA Tianjin / 中国民航大学中欧航空工程师学院

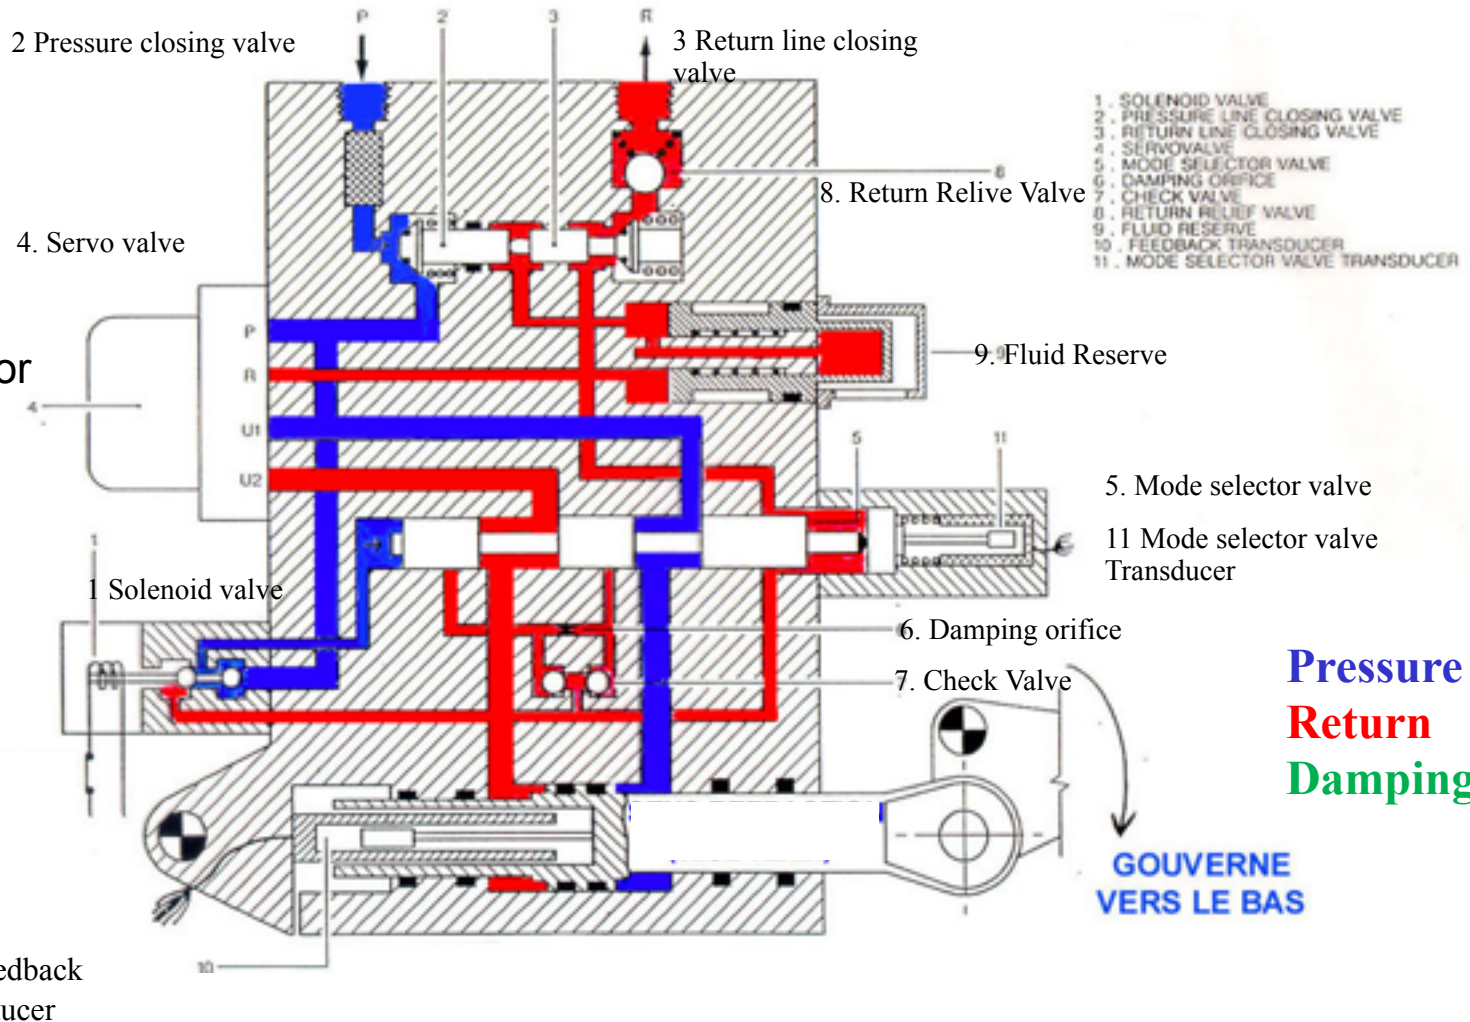

First generation Fly by Wire systems

Actuators with hydraulic source Left, Center or Right L1, L2, C or R Actuator Control Electronics (ACE)

GEA Tianjin / 中国民航大学中欧航空工程师学院

First generation Fly by Wire systems

■ Flight Control Computers overview

- B777 computers

2 Types of computers :

Actuator Control Electronics (ACE)

The primary functions of the ACE are:

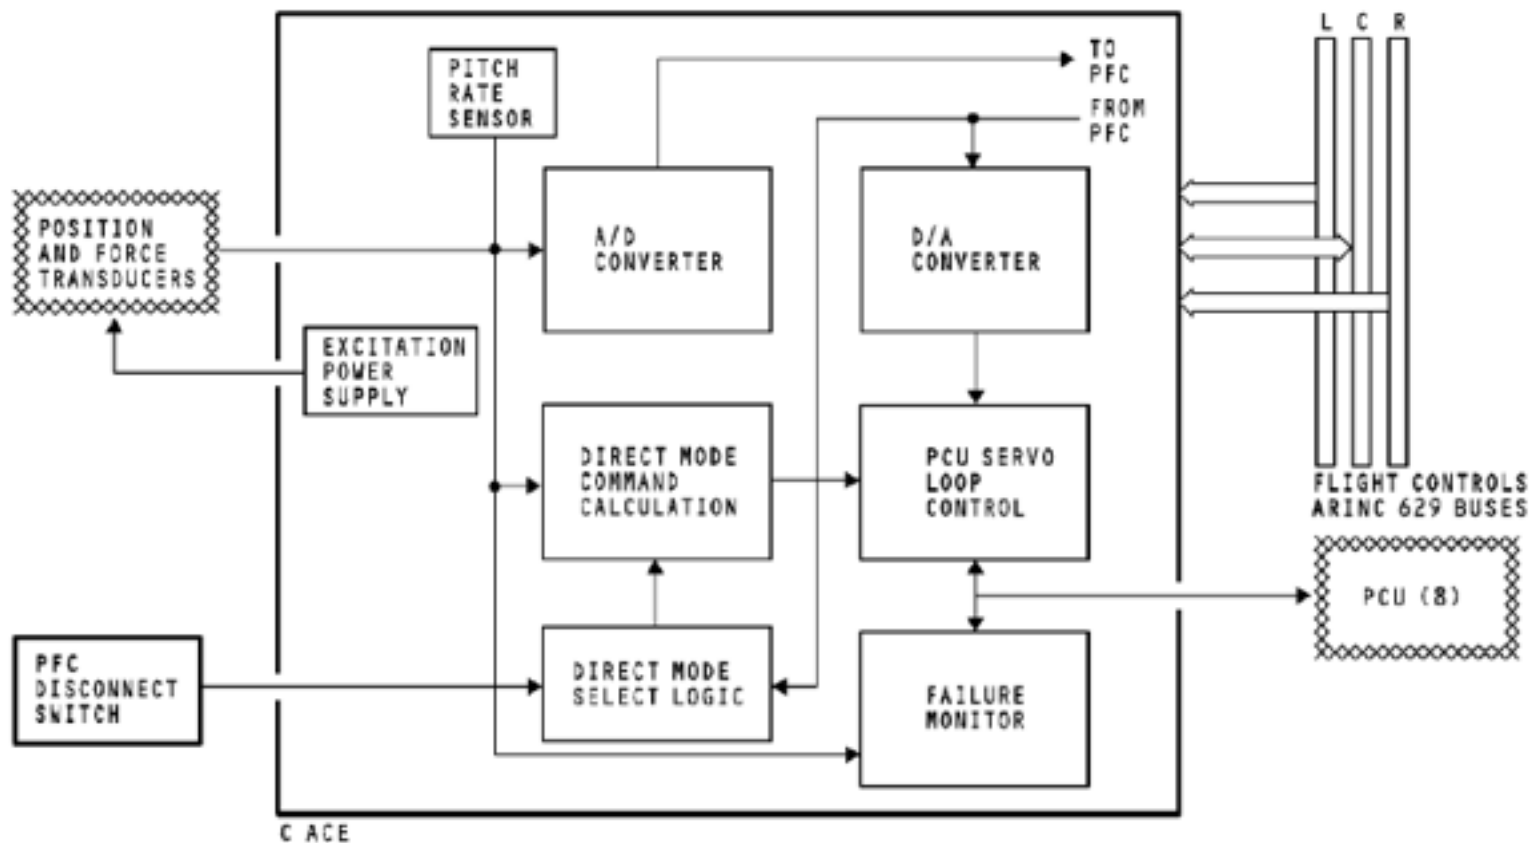

- * A/D converter
- * D/A converter
- * Direct mode select logic
- * Direct mode command calculation
- * PCU servo loop control
- * Excitation power supply.

GEA Tianjin / 中国民航大学中欧航空工程师学院

First generation Fly by Wire systems

- Flight Control Computers overview

First generation Fly by Wire systems

■ Flight Control Computers overview

- B777 computers

The primary flight computers (PFC)

- * Calculate control surface commands using pilot and autopilot inputs
- Calculate commands for variable elevator feel
- and backdrive actuators
- * Supply stability augmentation
- * Supply flight envelope protection
- * Send signals for flight deck annunciations
- * Send signals for maintenance messages.

The spherical bearing problem

GEA Tianjin / 中国民航大学中欧航空工程师学院

Issues

A320 elevator
actuator

Grease free
Teflon bearings
are not resistant
enough to
withstand the
harsh enviroment
Will be replaesce
by roler bearings

Flight control

- Max requirements concerning pilot actions (from ICAO)
 - roll 22.5 daN *diameter of wheel in m
 - yaw 90 daN
 - pitch 135 daN
- Example:
 - A340 aileron actuator provides more than 160 kN force.
 - A380 rudder actuator force will be >300 kN

GEA Tianjin / 中国民航大学中欧航空工程师学院

First generation Fly by Wire systems

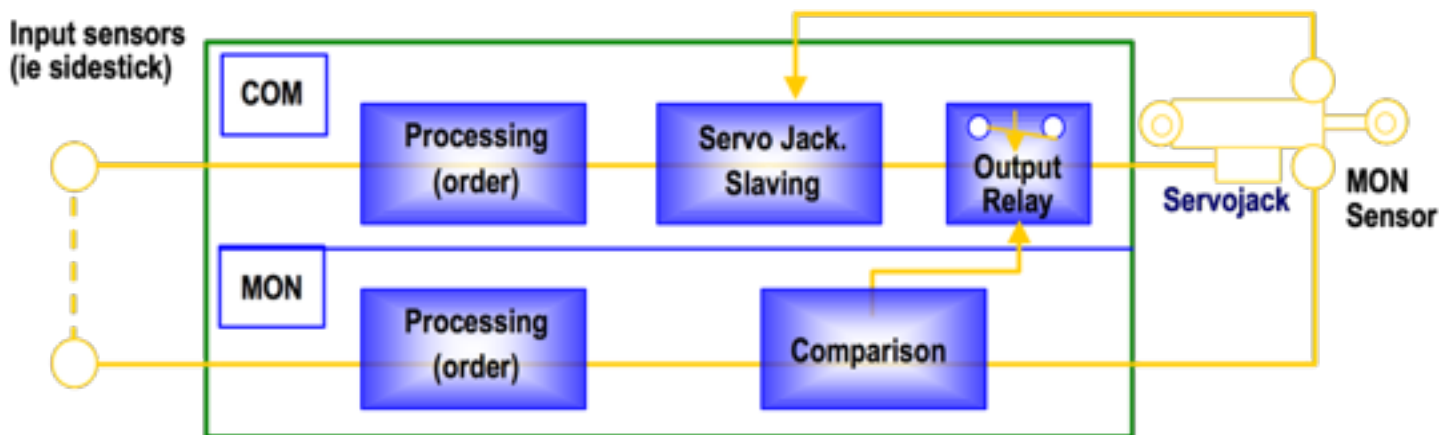

- Flight Control Computers overview
- Airbus computers
 - Flight control digital computers achieve
 - control law computation, which include flight envelope protection
 - actuator closed loop control
 - Associated monitoring and reconfiguration functions

GEA Tianjin / 中国民航大学中欧航空工程师学院

■ Flight Control Computers overview

- Airbus computers
- Flight control computers feature a COM/MON arrangement

- Any single failure leading to a COM/MON disagreement greater than a threshold (confirmed tbd seconds) is passivated
- After a single failure, the function is lost
 - with one COM/MON computer → fail passive architecture
 - With two COM/MON computers and automatic switchover → fail operative architecture (DUAL/DUAL configuration)

First generation Fly by Wire systems

- Flight Control Computers overview
 - Airbus computers
 - Flight control computers are dissimilar to overcome common mode failure or generic error in software
 - Two COM/MON computers are the minimum to provide a fail operative architecture
 - If dispatch with one computer failed is desired, then three COM/MON computers, or two triplex assemblies (3 triplex lanes is one computer) are needed
 - The actual number of computers is also the result of the architecture for actuators power loops computation :
 - ✓ SA family : 2 ELAC, 3 SEC
 - ✓ LR family : 3 PRIM, 2 SEC

GEA Tianjin / 中国民航大学中欧航空工程师学院

Fly by wire first generation

- End of session
- Thank you
- Any question?
